

To create a new horizontal log or sidetrack log from the current file, click on **File\Plug Back for Horizontal or Sidetrack**. This button is used to create a horizontal or directional well from a pilot hole or to plug back and side track. By selecting this, a dialog appears where a kick-off point can be entered.

MainLog automatically creates a new file name by adding a “-H” to the original file, however, it can be named to anything. You should make sure the name makes sense, by changing the "-h" to "-H2", or "-H3""-ST1", or "-ST2", etc. to reflect the actual circumstances.

Once the create button is clicked, all data below the KOP will be deleted and all

information above remains including all reports. You are now working with a new file.

*******The original file name will be archived in the **C:\mainlog\archives** folder **but will also remain in the C:\mainlog folder**. Should the kickoff fail, the original file can be re-selected by going to **File/Open** and a new plug-back or horizontal can be created from the new kickoff point.
